Scottyab/Rootbeer Project Report

The project has been conducted for 300+ weeks now, and half of the source files were completed within the first few weeks (As the graph shows below). Most of the effort was spent on the complete of two Java source file, Const.java and RootBeer.java.

Also, with different colour representing different developers in the graph, it clearly shows that the green and red did most of the work. According to data in the file "Yunhui_authorFileTouches", which records projects files and touches from developer on each of them, green and red should represent work done by Scott Alexander and Matthew Rollings respectively. They have done a great job in contributing and leading this project, especially Scott Alexander, who finished nearly half of the source files himself and kept paticipating in the project throughout the entire progress. Other developers have contributed little to the main part (src files) of the project.

I found out that "git log" was very useful when trying to analyze the growth of a project.
